EPDs within the same product category but from different programmes may not be comparable. EPDs of construction products may not be comparable if they do not comply with EN 15804. For further information about comparability, see EN 15804 and ISO 14025.

What is an EPD?

An Environmental Product Declaration (EPD) is an independently verified and registered document that communicates transparent and comparable information about the life-cycle environmental impact of products.

The following EPD has been developed by Volcán for its gypsum board products.

Company information

Owner of the EPD

Volcán S.A.

Web: <https://www.volcan.cl>

Phone: (56) 600 399 2000

Contact: Ricardo Fernández – Manager of Technical and Sustainable Development Area

Email: rfernandez@volcan.cl

Address: Agustinas 1357 Piso 10 - Santiago, Chile

Description of the organisation

Volcán is a Company leader in constructive solutions that generate habitability, comfort, efficiency and sustainability. Its purpose is to create a better living standard for people in each habituated space, for this and future generations.

Volcán's portfolio of constructive solutions is formed by:

- 1 Solutions for facades and internal division, such as Volcanita for different uses, Volcoglass, fibercement Volcanboard Siding and Volcanboard Deck, and ceiling access panels;
- 2 Solutions for roofing and climatization, such as asphalt shingles, membranes, felt and ducts;
- 3 Solutions for thermic isolation, acoustic absorption and energy efficiency, such as glass wool Aislanglass, mineral wool Aislan, Sonoglass and Rigitone;
- 4 Solutions for perfect finishes like gypsum plaster, fillers, composites, tape, Levelline corners, Volcastic, Volcabond, and;
- 5 Tools and solutions for passive protection to fire, such as compartments, seals and protection of metallic structures.

Additionally, Volcán offers technical advisory to answer the diverse needs of clients.

Sustainability

Responsible environmental management, protection of the environment and natural resources are a strategic priority for Volcán. This is why in 2014 the company created a Sustainability division, in charge of registering, controlling and learning about all the events that imply environmental impacts, as well as creating and consolidating a cross wise program called "Sustainable Volcán", formed by pillars structured according to all fields of environmental management, with the goal of configuring a sustainable management of waste, emissions, energy use, water use, noise levels, rainfall control, among others; in order to achieve a responsible environmental management.

At the moment, Volcán has the following ISO Standards:

- 6 ISO 9001:2015 - Quality management systems — Requirements
(https://www.volcan.cl/system/files/iso_9001.pdf)
- 7 ISO 14001:2015 - Environmental management systems
(https://www.volcan.cl/system/files/iso_14001.pdf)
- 8 OHSAS 18001:2007 Occupational Health and Safety Management Systems
(https://www.volcan.cl/system/files/ohsas_18001.pdf)
- 9 ISO 50001:2018 — Energy management systems
(https://www.volcan.cl/system/files/certificaciones_iso_50001.pdf)

Additionally, since 2016, Volcán has been developing its Sustainability Report, where sustainability strategic priorities are being addressed within the organization, including analysis of best practices, and research and focus group with internal and external stakeholders. This report is elaborated following Global Reporting Initiative (GRI) guidelines. The report represents a new era for Volcán, where it is not only about responding to the needs of clients, but also a concern about the surroundings and communities. The latest version of the Sustainability Report and be downloaded from the following link:

<https://www.volcan.cl/informe-de-sostenibilidad>

Name and location of production site(s):

Volcán S.A.

Planta CIVSA- Avenida Concha y Toro 0602, Puente Alto, Región Metropolitana

Product information

Product name

The products included in this EPD are Volcán's gypsum board products.

Product identification and description

UN CPC code: 3753

Volcán's gypsum board is mostly used as internal cladding, for ceilings, wall partitions or walls, with products designed for high traffic, water resistance and fire resistance.

Table 1 shows the different products covered in this study, with a short description and applications. The main difference between products is that some are designed for standard conditions, while other are fire or water resistant.

Table 1- Characteristics of gypsum board products covered in the study

Product	Short description and application	Wide (m)	Length (m)	Thickness (mm)	Weight (kg/m ²)
Volcanita ST	Gypsum board for ceilings, wall partitions, cladding of walls, among others. Mix of construction gypsum and additives, with paper in both faces to add resistance (Illustration 1)	1.2	2.40 / 3.00	15	12.0
Volcanita RH	Gypsum board specially designed for cladding of ceramics, vinyl or other material used for wet areas. Mix of construction gypsum and additives, with paper in both faces to add resistance. (Illustration 2)	1.2	2.40 / 3.00	15	12.0
Volcanita RF	Gypsum board specially designed for fire resistance uses. Mix of construction gypsum, additives, and glass fiber, with paper in both faces to add resistance. (Illustration 3)	1.2	2.40 / 3.00	15	10.5

Illustration 1- Volcanita ST

Illustration 2- Volcanita RH

Illustration 3- Volcanita RF

Content information

Table 2 presents the composition of Volcán's gypsum board products, as well as packaging materials. No dangerous substances from the candidate list of SVHC are included in the product.

Table 2- Product components

Product components	Weight, kg	Post-consumer material, weight-%	Renewable material, weight-%
Construction gypsum	10.2- 14.0	0%	0%
Paper	0.4	0%	100%
Additives	0.3- 0.7	0%	0%
TOTAL	11.3- 14.2	0%	3-4%
Packaging materials	Weight, kg	Weight-% (versus the product)	
Polyethylene	0.006	0.04-0.05%	
Paper	0.0431	0.30-0.38%	
TOTAL	0.0491	0.35-0.43%	

Dangerous substances from the candidate list of SVHC for Authorisation	EC No.	CAS No.	Weight-% per functional or declared unit
Not applicable			

LCA information

A life cycle assessment is a technique for assessing the environmental aspects and potential impacts associated with a product. By considering potential impacts throughout the life cycle of a product (upstream and downstream), the analysis avoids the shifting of burdens from one type of environmental impact to another, from one political region to another and from one stage to the other.

An Environmental Product Declaration (EPD) is an independently verified and registered document that communicates transparent and comparable information about the life cycle environmental impacts of products. The following information describes the scope and methodology of this EPD for Volcán's gypsum board products.

Declared unit

This EPD has a cradle to gate with options approach, with a declared unit of 1 m² of gypsum board installed in Chile.

Reference service life

The typical Volcán gypsum board product life is assumed to be the life of the building or 50+ years (Gypsum Association, 2021).

Geographical scope

The geographical scope of this EPD is Chile.

Time representativeness

The information collected for the analysis is 2020, considering the production of all products in this year.

Database(s) and LCA software used

The inventory data for the process are entered in SimaPro LCA program and linked to the pre-existing data for the upstream feedstocks and services. Data were selected per geographic relevance from ecoinvent 3.6 database (Ecoinvent Centre, 2019).

Description of system boundaries

This EPD is cradle to gate grave, however, given that some of the modules are not applicable for Volcán's gypsum board products, the scope is cradle to gate with options¹. Table 3 has the detail of the modules included. The following life cycle stages have not been declared, as they are deemed not applicable for Volcán: Material emissions from usage (B1); Repair (B3); Replacement (B4); Refurbishment (B5), Operational energy use (B6) and Operational water use (B7).

In the case of Waste processing (C3) and Reuse, recycle or recovery (D) these have been included in the analysis; however, they are both considered to be 0 due to a conservative scenario of all products going to landfill. This scenario responds to Volcán not having a reuse, recovery, recycling take back program for its products. Also on a national level, official data from the government in terms of circular economy in the construction and demolition sector indicates that the industry is very behind in this area. On one hand, the baseline is not very clear, since only 50% of companies declare their waste, only 8.4% of that is valorised, and within that the only materials with relevant data are steel, wood, other metals,

¹ Cradle to gate with options, modules C1–C4, module D and with optional modules (A1–A3 + C + D and additional modules). The additional modules may be one or more selected from A4–A5 and/or B1–B7.

and stone and gravel (Gobierno de Chile, 2020). Thankfully, this scenario could change in the future due to the Roadmap on Circular Economy for the Construction and Demolition Sector, where targets are a 30% valorisation of waste for 2025 and 70% for 2035.

Table 3- Modules declared, geographical scope, share of specific data (in GWP-GHG indicator) and data variation

	Product stage			Construction process stage		Use stage							End of life stage				Resource recovery stage
	Raw material supply	Transport	Manufacturing	Transport	Construction installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	De-construction demolition	Transport	Waste processing	Disposal	Reuse-Recovery-Recycling-potential
Module	A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D
Modules declared	x	x	x	x	x	NR	NR	NR	NR	NR	NR	NR	x	x	NR	x	NR
Geography	Suppliers mostly from Chile, but also Spain, Austria and Paraguay		Chile			Chile											NA
Specific data used	93%					-	-	-	-	-	-	-	-	-	-	-	-
Variation – products	+ -8% variation between products and the average					-	-	-	-	-	-	-	-	-	-	-	-
Variation – sites	Not applicable, only one production site					-	-	-	-	-	-	-	-	-	-	-	-

System diagram

Figure 1 presents the system diagram. The process starts previously with construction gypsum process (also done by Volcán), specifically grinding (primary, secondary and tertiary grinding to reduce the size of mineral gypsum) and calcination (dehydration of mineral gypsum in an oven working with electricity and natural gas, to obtain crystals with lower porosity and regular shape).

The gypsum board process itself starts with the mixing of gypsum with water and additives, creating plaster. Afterwards, the plaster is spread evenly over paper giving it shape and thickness, and then moved through 200m bands to forge. During this movement blades make the necessary cuts to provide the right dimension of the board. Drying is the final process, followed by stacking (with labelling) and storage.

Figure 1- System diagram

Foreground data sources and quality

Foreground data on raw material requirements, manufacture and distribution was provided by Volcán for the year 2020. Background data was retrieved from ecoinvent 3.6, which dates from 2019, for processes occurring in Chile and countries supplying raw materials. In compliance with the relevant PCR, generic processes were used for feedstock materials.

Data quality is considered medium to good. More details in Table 4 below.

Table 4- Foreground data sources and quality

	Product data	Module A1	Module A2	Module A3	Module A4	Module A5	Module B	Module C
Data	Range and physical properties	Raw material inputs Energy inputs	Transportation from national and overseas suppliers to Volcán's installations	Water inputs Consumable inputs Waste outputs Internal transport distances Emissions	Distribution information	Ancillary materials and energy for installation	Ancillary materials and energy for deinstallation	End of life of products
Source	Collected by Volcán staff for 2020	Collected by Volcán staff for 2020	Supplier locations provided by Volcán staff for 2020. Distances calculated with online tool. Transport specifications assumed from ecoinvent 3.6 processes.	Collected by Volcán staff for 2020	Collected by Volcán staff for 2020	Estimations based on products description and use made by Volcán staff	Estimations based on products description and use made by Volcán staff	Conservative assumptions given no take back scheme and low recyclability in Chile
Quality	Good.	Good.	Good.	Good.	Good	Medium	Medium	Medium

Exclusion of small amounts and cut off criteria

Environmental impacts relating to personnel, infrastructure, and production equipment not directly consumed in the process are excluded from the system. All other reported data were incorporated and modelled using the best available life cycle inventory data.

No other cut offs were necessary for the modules included in this EPD.

Allocation

For Volcán's gypsum board production there are no co-products from production and therefore allocation issues were avoided.

Environmental Information

Potential environmental impacts

- Module A1+A2 (raw materials and energy) has the highest impact contribution to most environmental impacts (13 out of 14 indicators, with an average 55% contribution among them). The highest contribution is to global warming potential - land use and land use change (84%), because of the paper in the product. In terms of total global warming potential, main impact contribution comes from natural gas used in the manufacturing process (26% contribution of the overall impact (Figure 2) of the product and 39% of the module). Construction gypsum and paper also show relevant impact in this category, contributing to 19% and 14% of total product impact, respectively.
- Modules A3 (manufacturing and packaging) and A4 (transport to site) have similar average impact contribution (16% and 13%, respectively) across the different impacts, although their main contribution is different depending on the specific indicator. In the case of A3, the main contribution is to global warming potential (biogenic) (48%, mostly due to maize starch and paper), abiotic depletion potential (minerals and metals) (32%, because of potassium sulphate) and water depletion potential (26%, mainly due to the water used in the process). Module A4's main contribution is to ozone depletion potential (30%) because of the use of fuels.
- Module C4 has a low impact contribution to most impacts, with the exception of acidification potential (60% contribution) because of gypsum board going to landfill generating emissions to air and water in the process.
- Modules A5 (installation), C1 (deconstruction) and C2 (transport disposal) present a low impact contribution to most impacts.

Figure 2- Input contribution to global warming potential, by module for 1 m² of Volcanita ST 15mm

Resource use

Resource use

- Module A1+A2 (raw materials and energy) has the highest contribution to total use of non-renewable energy, with 61% of the total, mostly because of natural gas (31% of total product contribution), construction gypsum (25% contribution) and paper (16% contribution), as can be seen in Figure 3. This module also presents an important impact in terms of use of net fresh water (57%), because of the relevance of reservoir hydro energy in the Chilean electricity grid². Additionally, this module has the most contribution to the use of secondary materials, thanks to the use of recycled paper.
- Module A3 (manufacturing and packaging) also has a relevant impact in terms of net fresh water use (27% contribution) due to the use of water in the manufacturing process. On the other hand, this module is responsible for 25% of total use of renewable energy, mostly because of the use of paper for packaging.
- Module A4 (transport to site) only shows a relevant contribution to total use of non-renewable energy, related to the use of fossil fuels.
- Modules A5 (installation), C1 (deconstruction), C2 (transport to disposal) and C4 (disposal) have a low contribution to most resource use.

Figure 3- Input contribution to total use of non- renewable primary energy, by module for 1 m² of Volcanita ST 15mm

Waste and Output flows

- Module C4 (disposal) has the highest contribution to non- hazardous waste disposed (Figure 4, with 69% contribution), because of conservative assumption that all products go to landfill at the end of life.
- Modules A4 (transport to site) and A1+A2 (raw materials and energy) have a relevant contribution to radioactive waste disposed (42% and 29%, respectively) related to the production of fossil fuels that generates this type of waste.
- In terms of hazardous waste, module A3 (manufacturing and packaging) has the highest contribution, with 47% of total impact, due to the generation of this type of waste in gypsum board manufacturing process.

² 12% according to the latest statistics by the Ministry of Energy of Chile (Ministerio de Energía, 2020)

Table 22- Information on biogenic carbon content

Results per 1 m ² of Volcanita RF 15mm		
BIOTENIC CARBON CONTENT	Unit	QUANTITY
Biogenic carbon content in product	kg C	-3.10
Biogenic carbon content in packaging	kg C	-0.33

Note: 1 kg biogenic carbon is equivalent to 44/12 kg CO₂.
